

VELOCITY

External Market Assessment

What people want, what they can already access, how Velocity compares, and where focused execution can create the most leverage.

EXECUTIVE VERDICT

Continue. Focus. Validate.

The problem is real and valuable. The opening is narrower than the internal strategy suggests, but a focused SAV-to-deck product for boutique researchers could be compelling.

A real market problem - but a narrower opening than expected

Velocity can win, but not by claiming territory that AddMaple and Displayr already occupy.

RECOMMENDED PRODUCT THESIS

The fastest, simplest and most private path from an analysis-ready SAV file to a defensible, editable client deck.

MARKET VERDICT

Proceed with focus

Velocity is a technically serious pre-release product with a credible survey core, local computation and an unusually capable agent surface. Its commercial proposition is not yet proven.

6 /10

OVERALL OPPORTUNITY TODAY

OPPORTUNITY SCORECARD

WHAT CHANGED AFTER LOOKING OUTWARD

Local-first survey analysis and agent-assisted research are no longer empty categories. AddMaple publicly claims both; Displayr now offers a survey-specific Research Agent and mature PowerPoint automation. Velocity therefore needs to win through execution, focus, usability, pricing and distribution - not category novelty alone.

What customers appear to want

The market is buying a shorter, safer path from survey data to a credible story - not crosstabs, AI or WASM in isolation.

1 Answers without a handoff

External signal. Vendors repeatedly promise that researchers can clean, test, cut and report without waiting for a specialist processing team.

Implication. Velocity must remove enough preparation work that analysts can genuinely operate independently.

2 Repeatable deliverables

External signal. Displayr, Q and E-Tabs emphasize linked reports, batch outputs and the ability to reuse existing PowerPoint templates.

Implication. Editable export is a starting point. Template fidelity and wave refresh are the higher-value outcome.

3 Defensible results

External signal. Modern agents are being sold with traceable calculations, visible tests and reproducible statistics rather than opaque answers.

Implication. Bases, weighting, assumptions, provenance and test explanations should be visible in the normal workflow.

4 A materially easier learning curve

External signal. Independent reviews praise incumbent power but also cite difficult navigation, training needs and overwhelming menus.

Implication. Simplicity is a credible opening. Do not recreate incumbent breadth and complexity before validating the core job.

5 Interactive speed

External signal. Users still report lag and slow refreshes in cloud-heavy tools, especially on large analyses.

Implication. Local computation could matter - but only after public, reproducible benchmarks prove the advantage.

6 Enough preparation to finish

External signal. AddMaple and established tools already include derived variables, recoding, reshaping, weighting and advanced survey methods.

Implication. Apply-only weighting and limited processing create a workflow break for the exact small-team persona Velocity targets.

7 As teams grow, sharing, governance and integrations matter.

These are expansion requirements, not prerequisites for proving the first small-agency beachhead.

What customers can already access

Velocity sits between inexpensive general-purpose tools and mature specialist platforms - but that middle ground is already contested.

THE ACCESS LADDER

FREE / GENERAL

ChatGPT, jamovi, JASP

Easy access and broad analysis. Weakest on survey-specific metadata, repeatable reporting and professional deliverables.

MODERN SPECIALIST

AddMaple

Browser-local processing, SAV import, AI analysis, weighting, advanced methods, text analysis and editable PowerPoint.

PROFESSIONAL INCUMBENTS

Q, Displayr, IBM SPSS

Deep survey/statistical capability, established trust and paid support. Often expensive, broad or training-intensive.

WORKFLOW / ENTERPRISE

Crunch, E-Tabs

Team-scale survey data management, dashboards, APIs or mass production of client deliverables.

THE REMAINING GAP

A plausible space still exists

Self-serve, transparent, survey-native, local/private, extremely quick to learn, and excellent at editable PowerPoint.

Velocity can occupy this space, but AddMaple means the product must win through superior execution, a narrower workflow, transparent pricing and a credible distribution wedge.

PRICE CONTEXT

Q

~EUR 2,819

per user / year

Displayr

~USD 3,359

Professional / year

Where Velocity sits in the market

Directional synthesis of public positioning - useful for strategy, not a substitute for hands-on product benchmarking.

STRATEGIC IMPLICATION

Velocity's opportunity is not to become a complete Displayr or SPSS replacement. It is to become the best product for one high-frequency workflow inside the upper-right quadrant: analysis-ready SAV to trusted, editable client deck.

How Velocity stacks up today

A credible survey-analysis core is already present. The largest deficits are workflow completion, reporting automation and commercial maturity.

● Strong foundation
 ● Credible opportunity
 ● Material gap

DIMENSION	VELOCITY TODAY	EXTERNAL MARKET BAR / ASSESSMENT
● Survey crosstabs & significance	Strong weighted crosstabs, ESS, pairwise and cell-vs-rest testing.	Expected across specialist tools.
● SAV fidelity & MR sets	Strong documented emphasis on metadata and survey structure.	A necessary trust foundation.
● Local privacy	Respondent rows remain local; session handoffs exclude raw data.	Valuable, but AddMaple also claims browser-local processing.
● Interactive speed	Architecture is promising.	Potential differentiator, but <u>not yet externally benchmarked.</u>
● Ease of use	Designed as an advantage.	Large opening because incumbent learning curves remain visible.
● PowerPoint workflow	Editable export is shipped; polish continues.	<u>Behind on template reuse, live refresh and recurring production.</u>
● Data preparation	Recodes and <u>limited visual ETL.</u>	Too narrow for analysts who lack processing support.
● Weighting	Can apply existing weights.	<u>Weight creation and diagnostics are likely adoption blockers.</u>
● Advanced methods	Mostly absent or frozen.	Behind, though not every method is a launch requirement.
● Open-text analysis	Semantic/AI direction is planned, not shipped.	Competitors already offer text analysis.
● Agent capability	Shared engine, CLI, MCP and portable sessions are unusually strong.	Good infrastructure; customer differentiation remains unproved.
● Commercial maturity	Pre-release, no pricing, deploy pipeline or established funnel.	The largest overall deficit.

The four contradictions that matter most

These are not messaging details. They determine whether the product can complete the job its target customer is hiring it to do.

1

The persona needs processing, but the product excludes it

Why it matters. A boutique researcher cannot become independent of a processing team if they still need that team to create weights, derived variables, nets and tracker-ready transformations.

Strategic response. Build a minimum viable processing layer - not a full SPSS replacement. ✓

2

'Anti-SPSS' overpromises relative to the scope

Why it matters. The phrase implies replacement and invites a breadth comparison that Velocity cannot currently win. The active strategy itself describes SPSS as a complement.

Strategic response. Position around skipping SPSS for everyday survey reporting.

3

Much of the future roadmap is catch-up

Why it matters. Raking, semantic AI, natural-language query, collaboration and direct imports are already represented in competitor offerings.

Strategic response. Sequence work by customer leverage, not by conceptual completeness.

4

Agent architecture is being treated as value too early

Why it matters. Buyers do not purchase MCP tool counts or architectural elegance. They purchase faster, safer completion of a familiar deliverable.

Strategic response. Sell bounded, supervised outcomes: first-pass deck, tracker update, client request assistant.

The risk: Velocity could spend years building a broader platform and still emerge as an elegant product that is permanently catching up.

Where focused execution can create the most value

The highest-leverage sequence strengthens the existing wedge before expanding the platform.

1

Prove and package the existing core

Ship a deployable build, durable projects, clear privacy language, statistical parity evidence, browser limits and real onboarding metrics.

2

Own the complete PowerPoint loop

Import or map a client template, preserve editable objects, save the recipe behind each slide, replace the dataset and review changes before export.

3

Add minimum viable survey processing

Prioritize RIM/raking, diagnostics, reusable derived variables, nets, banner plans, common reshaping and repeatable transformation recipes.

4

Turn trust into a product feature

Publish parity benchmarks, messy SAV edge cases, exact test definitions, missing-value behavior and known unsupported conditions.

5

Package the agent around bounded outcomes

Lead with first-pass deck, tracker update and client-request workflows. Keep manual control adjacent to every agent action.

6

Launch with an access advantage

Test transparent monthly, annual and per-project pricing below incumbent annual costs; validate willingness to pay with paid pilots.

Strengthen the wedge first. Broaden methods and collaboration only after paid users demonstrate retention and repeatable value.

The best initial market

Boutique quantitative agencies and independent consultants have the strongest alignment between pain, product capability and reachable distribution.

PRIMARY ICP

Boutique agencies and independent researchers

They are most attractive when they:

- Receive SAV files from fieldwork or processing partners
- Produce editable client decks as the primary deliverable
- Run frequent crosstabs, subgroup cuts and tracker updates
- Lack dependable day-to-day processing support
- Work on Mac or across mixed devices
- Care about respondent-data confidentiality
- Find incumbent licences or training burdens excessive

CORE JOB

Open a SAV file, validate it, answer the client and export an editable branded slide before a traditional processing request would have been acknowledged.

SECONDARY ICP

Small in-house insight teams

Pursue after direct imports, read-only sharing, governance controls, team templates and basic collaboration exist.

POOR INITIAL TARGETS

- **Large enterprises**
Procurement, SSO, audit, support and integration expectations are currently too high.
- **Academics**
Free tools and institutional licences reduce the reporting advantage and willingness to pay.
- **Advanced modelling specialists**
They immediately require methods and diagnostics not yet productised.
- **Generic AI users**
Horizontal tools are inexpensive and make Velocity's survey specificity harder to see.

What could become a moat

Several internally described moats are better understood as valuable capabilities. Defensibility must be earned through accumulated workflow assets and trust.

NOT MOATS YET

- Local-first computation - already duplicated
- Survey-correct significance - professional expectation
- Dual-state data model - implementation advantage
- MCP surface - differentiated plumbing, not distribution
- SAV support - important but available elsewhere

A moat is something that becomes harder to reproduce as customers use the product.

POTENTIAL DEFENSIBILITY STACK

1

Trusted survey benchmark corpus

Real-world parity tests, edge cases and methodology evidence reduce buyer risk and improve the engine over time.

2

Best-in-class deck compiler

Client templates, editable chart construction, automated appendices, wave updates and recipe-aware refresh can drive standardisation.

3

Portable, inspectable analysis recipes

The .velocity session can become a reusable interchange format between analysts, agents and tools.

4

Agent distribution

If multiple agent environments use Velocity as the trusted local engine, the product becomes infrastructure rather than another interface.

5

Workflow memory

Reusable banners, mappings, harmonisation decisions and report recipes create genuine switching costs.

The critical unknowns

These questions now require observed workflows, paid pilots and hands-on competitor benchmarking - not more desk research.

UNKNOWN	BEST TEST	SUCCESS SIGNAL
1. Which segment feels the pain most often?	Shadow 15-20 real projects across freelancers, boutique agencies and in-house teams.	One segment runs the target workflow at least monthly and calls turnaround materially painful.
2. Will customers pay?	Run paid pilots rather than free design partnerships.	At least 5 of the first 8 qualified pilots pay and request continued access.
3. Is local-first a buying reason?	Collect examples of blocked uploads, security delays or lost work; compare positioning tests.	Privacy measurably improves conversion or removes an actual blocker.
4. Is output quality competitive?	Blind-compare the same survey from Velocity, Q, Displayr and the analyst's current workflow.	A majority rate the Velocity output client-ready without rebuilding.
5. Can a new user complete the Friday 4 PM job?	Use unfamiliar SAV files in moderated and unmoderated usability tests.	Useful crosstab in under 5 minutes; acceptable editable slide in under 15.
6. Does the engine survive real-world files?	Compare at least 30 customer datasets with established outputs.	No unexplained material differences within the supported scope.
7. What are the practical browser limits?	Benchmark representative file sizes on ordinary Windows and Mac hardware.	Stable at the target segment's 90th-percentile file with clear warnings above it.
8. Does the agent improve outcomes?	Randomise users across manual, suggested and agent-built workflows.	Meaningful time reduction without more corrections or trust failures.
9. How large is migration friction?	Import real banner plans, templates and tracker waves.	Customers can reuse a meaningful share of prior work.
10. How strong is AddMaple in practice?	Obtain demos, customer references, pricing and a hands-on workflow comparison.	Evidence of at least one durable Velocity advantage beyond price.
11. Can Velocity acquire customers efficiently?	Test practitioner communities, agency partnerships, SAV utilities and template-led content.	A repeatable source of qualified users beyond founder-led recruitment.

Commercial packaging, pricing, browser limits and competitive response are already acknowledged as open questions in the internal profile. The next step is direct evidence.

Overall evaluation

The product is worth continuing - provided the market thesis is narrowed before the roadmap expands.

THE POSITIVE CASE

A strong foundation for a compelling professional tool

Velocity is aligned with a workflow for which customers already buy expensive specialist software. Local execution, survey semantics, provenance, portable sessions and editable output are credible foundations.

THE NEGATIVE CASE

A broad platform could become permanent catch-up

AddMaple is strong on modern local-first breadth; Q, Displayr, SPSS, Crunch and E-Tabs are strong on maturity, trust, automation or organisational adoption. Breadth alone will not close that gap.

FINAL RECOMMENDATION

Proceed - but reset the market thesis before expanding the roadmap.

The biggest risk is not technical execution. It is building a broad platform before proving which narrow outcome customers will reliably pay Velocity to own.

RECOMMENDED NEXT DECISIONS

- 1 Launch around one sharply defined SAV-to-deck workflow.
- 2 Recruit paid boutique-agency and consultant pilots.
- 3 Make PowerPoint templates and repeatable wave updates exceptional.
- 4 Add minimum viable weighting and preparation.
- 5 Publish trust and performance benchmarks.
- 6 Present the agent as an auditable outcome generator, not infrastructure.
- 7 Delay broad advanced statistics, enterprise collaboration and general-purpose AI until retention and willingness to pay are demonstrated.

Methodology and source notes

Public product pages establish availability and positioning, not independently verified product quality. Vendor claims are treated as claims.

METHOD

This assessment combines the attached internal deep product profile with public competitor pages, pricing pages, official help documentation, practitioner review evidence and recent market reporting. It is a strategic desk-research synthesis. Hands-on product tests and paid customer observation are the recommended next step.
